

J.A.G. Weather

From the beginning of this pandemic (covid-19), airplanes and other flights have dropped by sixty percent (60%). Most planes have little sensors on them that help predict the weather while they are in the air. Since lots of planes have stopped flying, weather accuracy has gone down as well. The Weather Network isn't very reliable for any weather that is not today anymore, and that is where J.A.G. Weather comes in. Me and my brothers decided it would be fun to make a weather app where only today's weather would be correct, the rest would be random. We decided to name it J.A.G. Weather, and the J.A.G. would stand for Just A Guess. We designed a logo and what it would look like. J.A.G. will make weather more interesting.

We decided to make the JAG weather app because during the covid 19 outbreak we learned that the global weather network's accuracy went down because the planes in the atmosphere helped them and increased their accuracy by (I think) 15%. We thought it would be fun to make an app that was correct on the same day and partly (or even wildly) incorrect on the days other than today on this week and next week.

APP: JAG Weather (JAG stands for Just A Guess)

Purpose: See above

Purpose: Since there's no one at work to do the weather, we thought we would not ^{make} our own that would have the temperature at the moment and a guess for everything else. correct
